BUSINESS INTELLIGENCE OVERVIEW REPORT

Part 1 – Business Understanding | Superstore Sales Dashboard Project

1. What Is Business Intelligence?

Business Intelligence (BI) refers to the systems, strategies and technologies an organisation uses to collect and analyse data, and to turn it into insights that inform decisionmakers. BI combines data analysis strategies with supporting technologies to deliver the insights that power better, evidence-based decisions.

2. Why Organisations Use Dashboards

Dashboards give organisations a quick view of the most important aspects of their data. They provide real-time insights and competitive analysis, highlight items that need urgent action, streamline workflows and help direct resources where they are needed most. Dashboards are especially valuable when:

- **Managing and sharing reports:** report creation is resource-intensive and needs constant upkeep to meet differing, and sometimes competing, requirements.
- **Monitoring activity:** tracking filings or submissions by business unit, geographic region and over time.
- **Periodic reporting:** quarterly and annual reporting, including spend over time.
- **Workload management:** reporting on tasks, work assignments and workload.
- **Personalising content:** giving each type of user a tailored view, such as an attorney view versus an operations view.

3. How Dashboards Improve Decision-Making

Interactive dashboards make it easier for organisations to move from data collection to action. The biggest advantages are:

Advantage	What it means	Impact on decisions
Faster access to information	Users see the key metrics instantly instead of reading dozens of pages of findings.	Quicker responses to problems and opportunities.
Better trend identification	Visuals reveal patterns that are easy to miss in spreadsheets or traditional reports.	Earlier detection of growth areas and risks.
Improved collaboration	Information is presented visually, so teams can discuss findings from the same view.	Departments align on shared priorities.

4. Business Objective of the Selected Dataset

To identify which products, regions, categories and customer segments the Superstore should target for growth and which it should avoid or improve, so that management can focus resources on the areas that deliver the highest sales and profit.
